Did you know that there is more than one way in PDF software such as PhantomPDF to apply your signature to the document? Two ways: Fast Sign PDF Digital Signature They are very different - not only in the way you create signatures, but also in what information they provide. Let's take a closer look. The Fast Sign PDF Fast Sign PDF feature allows you to create signatures and add them directly to the pages. Unlike the digital signature and digital ID that we cover below, fast signatures don't have a single attribute that a digital signature doesn't have, and they're not registered with any certificate bodies. It's basically an image of your signature that you can create by scanning a piece of paper with a signature on it or drawing a signature mouse in a PDF software. When you need to apply your signature to the document, you choose PROTECT's Protect zgt; PDF Sign to create a signature. That's all there is to it. It's effective, but not as safe as other options. Signing a PDF document using digital signature digital signatures created in PDF software may look like traditional handwritten signatures, but they do much more. Digital signatures provide identification information outside the signature ink or the signature of a quick PDF sign, such as the date, time, and status of the document when it is signed. Digital signatures also allow you to create a signature or multiple signatures for different types of documents. When designing a digital signature, you have the option of incorporating attributes like: The image of your handwritten signature is your name Logo your company's Contact Information Reason to sign the document Your Location List can give as many details as you need in order to verify your identity. Turn a digital signature into a digital ID, you can improve security by turning your signature into a digital ID if you register it as a certificate body (CA). CA is a trustee that issues electronic documents, called digital certificates, to verify the identity of a digital organization on the Internet. The digital certificate contains a public key used to encrypt and decrypt a digital signature. You distribute a certificate containing public key and other identification information to those people who need to use it to verify your identity, verify your signature, or encrypt your document for you. Only your personal key can unlock information that has been encrypted with a certificate, so make sure you keep your digital ID in a safe place. Not only can you get a digital ID from CA, but you can also create a self-signed digital ID with Foxit PhantomPDF. Digital identities are usually password-protected, and you can store them on your computer in PKCS-12 or in-store format Windows. Signing a PDF document To sign a document using Foxit PhantomPDF software, use the Sign Document dialog and select it from the menu. Note that several people can sign and do it more than once, if necessary. Using PDF software, you also have the ability to verify other people's signatures. Here's what to look for: The question mark indicates that the signature has not been verified. The check mark indicates that the signature is valid. The red x badge indicates that the signature is invalid because the document has been modified or damaged since the signature was applied. The warning triangle icon indicates that the document was changed after the signature was added; however, the signature is valid. A person with a question mark indicates that the expiration date is unknown because the signature certificate is not on your trusted identity list. For added security, you can password protect your signature, so that anyone else using PDF software can't forge a document with your signature. Why not start today! Signing documents is such an age-old part of our working day that we are unlikely to give him a second thought. And that's the problem. It's an age-old process. One that is difficult to manage, verify, secure and upgrade. How widespread is it? Studies show that a staggering 80% of all business processes rely on forms, and many of these forms need to be signed. This can lead to an expensive cascade of follow-up operations that includes everything from printing paper documents to delivery delays that cost time and money. These and many other reasons why digital signature can be a much better option for day-to-day business operations. Digital signatures beat handwritten signatures, hands down digital signatures in PDF documents and PDF forms capturing your John Hancock just like traditional handwritten signatures, only better. Digital signatures allow you to use any signature you like, including graphics such as handwritten signature and company logo, as well as text such as your name, organization, country and location. But unlike their unusual counterparts, they come with an authentication process built in directly. What's more, from a business perspective, standardizing digital signatures in PDF software, your company retains control over the signing process and the types of applications used to sign documents. And you keep the ability to keep signed documents up to date, even when technology changes. Foxit PhantomPDF provides you with three different ways to sign a PDF: Using an image of your own However, with the help of digital signature, you first need to obtain a digital certificate from a reputable third-party certificate authority. Using an electronic signature, also known as eSignature, where you can use PhantomPDF, built-in integration with DocuSign - eSignature supplier. Unsurprisingly, PhantomPDF for business goes beyond the basics, allowing you to specify the level of content approval viewers your PDF has. It also allows you to specify the types of changes that are allowed for THEFS to remain certified. This allows you to check the digital signature status in the PDF document you receive to determine if the document has been changed since it was signed. Want even more security? Using a digital certification Digital Certificate provides an even tighter level of verification and security. It is used to link public keys to individuals or other organizations and is actually signed by a trusted third party. PhantomPDF for business allows you to certify PDF documents and specify what changes can be made to the file after that. Whenever approved changes are made, the certificate remains valid and intact. However, if someone tries to make changes that you did not allow, the certificate will be revoked. Anyone who reviews your PDF document after that will be notified that the document has been tampered with. So the next time you need to sign the paperwork, consider putting down a pen and cracking open a Foxit Reader or PhantomPDF instead. Your wrist tunnel and your business will be better for it.
